

Expense Tracker System - Project Report

Objective

To develop a C++ application that records, manages, and analyzes personal expenses using file handling.

Introduction

This project allows users to add, view, delete, and summarize expenses. Data is stored in a text file so that expense records persist between program executions.

Features

1. Add Expense
2. View Expense History
3. Calculate Total Spending
4. Delete Expenses
5. Category-wise Summary
6. Persistent Storage using expenses.txt

Technologies Used

C++, Object-Oriented Programming, Vectors, File Handling, String Processing, and Menu-Driven Programming.

Modules

Expense Class: Stores amount, category, and date.

Save Module: Writes expense data to a file.

Load Module: Reads saved data from file.

Expense Management: Add, View, Delete expenses.

Reports Module: Total spending and category summaries.

Advantages

Easy to use, data persistence, expense categorization, and spending analysis.

Limitations

Uses text files instead of a database, limited validation, and fixed category summary logic.

Future Enhancements

Monthly reports, graphical analysis, budget alerts, database integration, and advanced search/filter features.

Conclusion

The Expense Tracker System demonstrates practical use of C++ programming concepts such as classes, vectors, file handling, and data management while helping users track their spending effectively.
